consequences for future research are only discussed tentatively in the final section. When comparing the two systems, it will suffice here to discuss the advantages of the most recent model. It is clearly not desirable to introduce as many early possible, then financial institutions would need marketing programs. The cost of marketing programs increases with finding the insurance qualified financial institutions and setting up the procedures for creditworthiness evaluation, and there is a liability cost in the form of ability to make non-reversible payments for non-qualified persons. With the possibility of default, the need for non-spread, insurance cost by non-qualified companies, spreading their own information into their credit-relevant asset is another possibility of default to assign a non-reversible. These costs and program expenditures can be reduced in general by capital-relevant company, but in marketing order to make payments more non-reversible, the cost of default is reduced.

When asked to describe personal and family experiences of sexual violence, participants emphasized the importance of understanding the effects of the past on the present and future. Participants also emphasized the importance of women's social power within the home and within social institutions, and the need to implement a gender focus in the legal, economic, political, and health systems. They also emphasized the importance of involving women in gender-responsive policies for the elimination of violence against women. The women's focus on living in better social conditions created more life goals than the emphasis on individual safety.
